

Fuze Voice

Traditional Technology Meets Modern Delivery

A complete PBX replacement, the Fuze enterprise communications platform provides the traditional functionality of an on-premise telecom solution without the traditional burdens — capacity management, CAPEX spend, platform maintenance, and unpredictable costs.

One Global Network

With Fuze, you have a single global network. Fuze leverages a resilient cloud infrastructure and QoS-engineered network to deliver the best enterprise-class IP PBX voice service available. All for a fraction of the cost of legacy premise-based systems. Local versus long distance calling tiers are a thing of the past — with one global network, we are able to extend unlimited fixed-price calling across the globe. What's more, Fuze offers the largest selection of countries available in a single unmetered price bundle. If you prefer predictable monthly costs for global calling, we've got you covered.

Localized Calling Experience

Many business VoIP providers can provide you with a call connection to another country, but what is the experience for the caller? Will the dial tone sound familiar? What about the ringtone that you hear while waiting for the person on the other end to answer the call? Sometimes it's the little things that matter most. At Fuze, end user experience is our priority. We offer a localized calling experience to our end users across the globe. We believe that seamless is more, and this is just one way that we simplify the business communications experience.

More than just a phone system

With our cloud-based platform, you get much more than just a phone system. Fuze delivers a modern enterprise communications experience with the flexibility to communicate any way you want whether it's by using deskphones, laptops, or mobile devices. Fuze helps you do more with less, complete with a modern messaging platform supporting IM, group messaging, and presence in one app.

Additional Benefits:

- 100% virtualized infrastructure and automated capacity management allowing for enterprise scalability
- Subscription pricing model
- Pre-built integrations to common cloud applications and APIs for third-party integration
- Highly secure SSAE16 compliant environment
- Worldwide delivery centers & customer-facing teams
- Enterprise-wide administration and self-service capabilities
- Reduced complexity due to fewer vendors (data and voice carriers, hardware, software)
- A turnkey solution, eliminating customer involvement with telco and carrier providers
- Lower hardware, maintenance, and regional personnel costs
- Platform data centers and network managed by dedicated 24x7x365 regional NOCs
- Localized services including emergency service, proper E.164 formatting and short-codes
- Network design and delivery team dedicated to ensure properly deployed QoS solution
- PCI compliance enablement tools for voice and messaging
- Multiple data centers in different regions around the globe remove single point of failure (e.g., North America, Europe, and Asia)
- Integrations with 3rd party SAML 2.0 IDP
- Real-time call data providing a searchable history of every call
