HARMONIOUS INTEGRATION
WITH SUSTAINABLE VALUE

URBAN SYSTEMS

SPECIALIST IN SYSTEM ENCLOSURES

Our urban systems can be individually planned and fit harmoniously into both existing and newly planned residential properties and their surroundings.

Thanks to our versatile modular system with a wide variety of supporting structures, side casings and roof structures, everything is covered in the planning and implementation.

For each structure, our customers receive detailed construction and approval planning with foundation specifications.

High quality is a matter of course for us. Production is done exclusively in Germany with state-of-the-art production technology and using materials with factory certificates. As a result, we satisfy the highest technical requirements and fulfil all applicable standards.

projekt w

projekt w is a shareholder-managed medium-sized company with a family character. We value close links with our customers and employees – always striving to develop long-term relationships.

With the “family-friendly company” distinction, we also see it as our responsibility to society, among other things, to introduce young people into working life. For this reason, we are very active as an accredited training organisation.

ROOF TYPES

GREEN ROOF

Green roofs offer a range of economic, building technology and ecological benefits. They create a habitat for plants and animals, improve the micro-climate and ensure a green balance. At the same time, they capture dust and provide sound insulation.

We have developed our green roofs in accordance with the guidelines for flat roofs and the FLL (Forschungsgesellschaft Landschaftsentwicklung Landschaftsbau e.V., Landscape Research, Development and Construction Society).

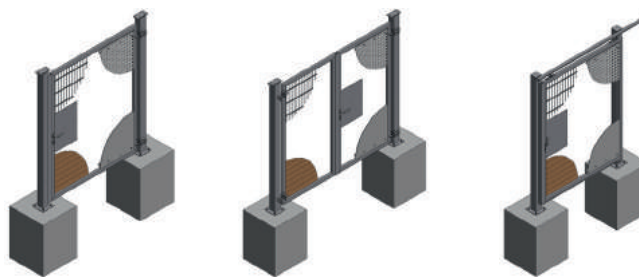

INDIVIDUAL AND FLEXIBLE

MODULAR SYSTEM

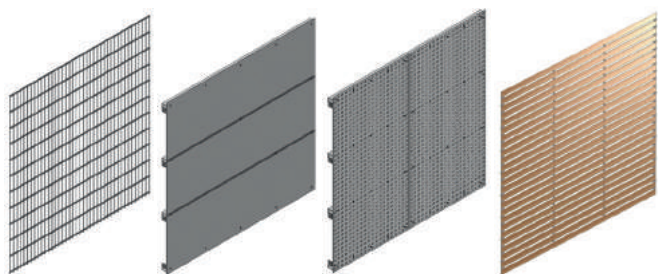

SUPPORTING STRUCTURES

DOOR ELEMENTS

SIDE CASINGS

ROOF TYPES

With the modular system, bracket and support systems are combined with a wide variety of roof types. In addition, you have the option of choosing from various side casings and door systems in order to give your system enclosure an individual touch. In the process, products from our company can be adapted for almost all geometrical floor plans in order to thus make optimum use of your property.

ROOF TYPES

TRAPEZOIDAL SHEET

The trapezoidal sheet is used for the economical design of roofs. The galvanised rolled section, made from steel, is coated with protective lacquer on one side, while the other side gets a powder coating which is available in a variety of RAL colours.

Also fitted with anti-condensation fleece, the formation of dripping water is prevented and, at the same time, sound insulation is achieved in the rain.

QUADROS

The Quadros pavilion with a canopy roof design is seeing increasingly frequent use in public places such as schools, administration buildings or parks as well as on private property. It provides protection from the weather or serves as a smoking shelter.

In order to create a space which is flooded with light, double-skin polycarbonate is chosen as the roof cladding. Quadros also provides sun protection with a sheet metal covering as an opaque alternative.

WASTE COLLECTION AREAS

With the versatile system enclosures from projekt w, architects, housing associations and planning companies have the opportunity to design waste collection areas individually and attractively in order to satisfy the stipulated

space requirements for storage areas. A wide variety of waste disposal concepts can thus be considered thanks to the consideration of waste generation, collection intervals and the condition of the space.
